

# Flushing machine

**TURN MACHINE OFF BEFORE STARTING THIS PROCESS**

**Lift bowl out of base and place in bucket**

**Drain the water in the tank by running both taps until empty.**

**Put your finger through the hole in the plastic plate and pull upwards to lift out.  
Might need to twist it a bit to get it out.**

**Clean out any residue that might be in the tank with a clean cloth.**

## Option 3

**Unscrew the plug at the back to drain the hot tank.**

**Have a bucket / jug ready under it to catch water**

**You will need about 4 liters of white vinegar undiluted.  
This works best as it doesn't only disinfect but it also removes  
any calcium build up in the machine**

**Use a funnel to pour into the  
spout that leads to the hot tank until it overflows**

**Pour vinegar in the cold tank, until all pipes are covered or all calcium residue is submerged.  
You can dilute with water, but more effective to use straight.**

**Cover the tank with cling wrap.  
Let the vinegar sit in the machine for as long as possible,  
at **least 4-5 days** to work effectively.**

**It's a good idea to do this when going away on holiday**

**Drain vinegar by running both taps & unplugging hot pot plug at the back.**

**Rinse machine by flushing a few buckets of water run through it or place outside with a hose running water through it.**

**You can wedge a pair of pliers in the tap section to hold it down to let the water run out without having to hold down the taps.**

Mix a bucket of water with 1 cup of bicarb soda

Pour the mixture into the machine and let it sit for 24 hours.

**Drain again by running both taps & unplugging hot pot plug at the back.**

**Rinse machine by flushing a few buckets of water run through it or place outside with a hose running water through it.**

**Reassemble bowl & fill up again.**
